

TrueNute Nitrate

Thank you for your purchase of

TrueNute Nitrate!

The idea is to get your nitrate level up to at least 20 PPM but not more than 80PPM.

You will want to start with about 0.5 ounces per 100 gallons of water if your Nitrate level is below 20 PPM. Every system is different, and will react different to the first dose. After that things will normalize and you can get a good feel of how much to add weekly. Always test your nitrate level before you add Truenute Nitrate and then a few hours later and document the PPM's of nitrate in the sytem. This will help us direct you on how to proceed if help is needed. As your fish grow, you will need less of TrueNute Nitrate.
