

TrueNute Potassium Silicate

Thank you for your purchase of
TrueNute Potassium Silicate!

- True Aquaponics Potassium Silicate is fully water soluble.
- Can be used in the germination of seeds, or propagation of clones.
- Can be used in the vegetative growth, or flower stages.
- Can be used in drench feeds, hydroponic systems, soil, coco, soilless mediums, and foliar sprays.
- Consistent Drench Feedings: Use at 33 PPM or .50grams/gal.
- Every week Foliar Spray: Use at 33 PPM or .50grams/gal
- In Aquaponics or Hydroponics, use 1/2 ounce per week per 100 gallons.
- To safely raise your Aquaponics System PH, start with 2 ounces for 1000 gallons of system water. Do not change the PH more than 0.2 per 24 hours. Check the PH after 4-6 hours.

.50 grams is about 1/8 of a teaspoon, go with that and you will be close enough. Here at True Aquaponics, we use up to 1/2 of a teaspoon.

Please note, that this mineral has a habit of clumping up when exposed to air. Try to keep your bags closed and out of sunlight. For the clumps, they weigh out the same as the powder. If you want you can crush the clumps back into powder, but it will fully dissolve in water either way.
